

## **Abstract**

This document presents a study entitled "Indicators for the choice of used housing", which resulted in defining a requiring programme of an evaluation method of quality of used housing.

The study range is whole housing stock, especially used housing.

The aim of this study was to create a simple, prompt and user-friendly tool.

The first chapter refers to theoretical framework: range limitation, object characterization, and investigation restrictions, some consideration about previous studies being developed.

In the second chapter a presentation of used methodology is made.

The third chapter presents the gathering of models and supportive information for the establishment of the programme of indicators.

The evaluation method proposed in this study is described in the fourth chapter, as well as indicators are presented, and evaluation criteria are defined.

Finally, closing considerations about this study are made in the fifth chapter, and some possibilities about future development are presented.
