Conclusions

There were no statistically significant differences between the two groups of patients concerning age, gender, school level, disease duration and civil status. Nevertheless, Group 1 patients' presented a lower body mass index than Group 2 patients'.

Methods

Two groups of patients were assessed:

- Group 1: 57 patients already submitted to obesity surgery, with a mean BMI of 36.20 (SD=7.34).
- Group 2: 34 patients, candidates to obesity surgery, with a mean BMI of 43.21 (SD=6.55).

There were no statistically significant differences between the two groups concerning age, gender, school level, disease duration and civil status. Nevertheless, Group 1 patients' presented a lower body mass index than Group 2 patients'.

Results

Data analysis revealed that there are no statistically significant differences between the two groups of patients concerning stigma perception – to feel different from other people, t(88)=1.66; p>.05; to feel that, because of his/her condition, the others feel uneasy, t(88)=.76; p>.05; to feel the others avoid him/her because of his/her condition, t(88)=1.56; p>.05; to feel that his/her condition prejudices his/her relationship with friends, t(88)=.47; p>.05. The single domain in which we have observed significant differences was to feel the others prejudices his/her relationship with friends, t(88)=2.27; p>.05, perception that is higher in Group 2 patients'. Stigma perception showed not to be high in both groups of patients.

Conclusions

Contrary to the common-sense idea, this study shows that stigma perception associated to obesity is not high in candidates to obesity surgery and in patients who were submitted to obesity surgical treatment.

Background

This study aims to compare stigma perception between candidates to obesity surgery and patients who were already submitted to surgical treatment.

Methods

Two groups of patients were assessed:

- Group 1: 57 patients already submitted to obesity surgery, with a mean body mass index (BMI) of 36.20 (SD=7.34).
- Group 2: 34 patients, candidates to obesity surgery, with a mean BMI of 43.21 (SD=6.55).

There were no statistically significant differences between the two groups concerning age, gender, school level, disease duration and civil status.

Nevertheless, Group 1 patients' presented a lower body mass index than Group 2 patients'. Patients answered to the Stigma Scale in the context a personal interview.

Results

Data analysis suggested that there are no statistically significant differences between the two groups of patients concerning global ill-being, t(89)=1.97; p>.05, nervous system symptoms, t(87)=1.47; p>.05, and digestive symptoms, t(89)=43; p>.05. Nevertheless, patients who were already submitted to obesity surgical treatment report higher well-being, t(89)=3.80; p>.05, and lower ill-being related to muscular, t(88)=2.12; p>.05, and respiratory symptoms, t(89)=2.81; p>.05. Moreover, patients of both groups revealed to present a medium level of well-being and of global ill-being (namely of muscular symptoms), but high level of nervous system symptoms and low level of respiratory and digestive symptoms.

Conclusions

Surgical treatment seems to contribute to better well-being and to the improvement of ill-being in patients suffering from obesity. Nevertheless it will be necessary to develop longitudinal studies to confirm this impact.

P-168 Preoperative Treatment with the Antiobesity Medication Sibutramin Improves Perioperative Outcome

Presenter: J. Aberle (University Hospital Hamburg, Hamburg, Germany)

Co-authors: O. Mann1, P. Busch1, A. Freier1

1University Hospital Hamburg Hamburg Germany

Background

Obesity in an independent risk factor for bariatric surgery. Previous studies have shown, that a preoperative weight loss is associated with a better long term outcome, fewer complications, and less time in the operation room in bariatric patients. However preoperative weight loss is hard to achieve in many patients.

Methods

We therefore conducted a study in which 25 bariatric patients received 15 mg of the weight loss medication sibutramin prior to laparoscopic roux-en-y gastric bypass. It was our interest to find out, if these patients had a benefit compared to a control group who did not receive medication.

Results

Obesity in an independent risk factor for bariatric surgery. Previous studies have shown, that a preoperative weight loss is associated with a better long term outcome, fewer complications, and less time in the operation room in bariatric patients. However preoperative weight loss is hard to achieve in many patients. We therefore conducted a study in which 25 bariatric patients received 15 mg of the weight loss medication sibutramin prior to laparoscopic roux-en-y gastric bypass. It was our interest to find out, if these patients had a benefit compared to a control group who did not receive medication.

Conclusion

Medical therapy with sibutramin in preparation for bariatric surgery can improve health status of patients and lead to a reduction of liver size and operating time. It should be considered as an alternative or addition to dietary therapy or gastric balloon treatment in preparation of patients expecting a roux-en-y gastric bypass.

P-169 Obese Pregnant Women with Gestational Diabetes Mellitus: Fears, Anxieties and Beliefs as to Becoming III and Being Hospitalized

Presenter: A. Fregonese (Irmã Blanca Hospital of the City of São Paulo, São Paulo, Brazil)

Co-authors: L. Theodoro1, L. Pinto2, C. Malheiros3, L. Hsu4, W. Bruscato3

Background

The so-called “high-risk pregnancy” represents an emotional and a social problem. The objective of this study was to identify the emotional questions involved in the diagnosis of gestational Diabetes Mellitus, with hospitalized pregnant women whose BMI was over 30.

Methods

This was a retrospective study with 72 pregnant women, which made use of a semi-structured interview protocol.

Results

The average age was 27 years. As for the gestational age, 30% were in their first quarter, 40%, in their second quarter, and 30%, in their third...
