Lee's theory of six love styles (1973) and the “Love Attitude Scale (LAS)” developed by Hendrick and Hendrick (1986) have been one of the major focuses in romantic love research since late 1980s. However, few researchers systematically explored adult-span differences and similarities in love attitudes. This study investigated adult-span patterns in love attitudes variation of people from teenage years through their nineties. Measures assessed demographics, and love attitudes. Results indicated that rank of preference for love attitudes is stable across adulthood: Eros, Agape, and Storge get the most endorsement, while Ludus,Pragma, and Mania get the least endorsement. In average, males were more ludic and agapic than females. The data indicated that age is related to response on Eros, Ludus, Pragma, Mania, and Agape.
